The new standard in flame-retardant transfer technology

FR+ by Polymark, innovation in flame-retardant transfers for protective clothing

FR+ by Polymark: safety from fabric to transfer

In environments with flame risks, safety starts with the protective clothing. Whether the fabric is inherently flame-retardant or treated with a flame-retardant coating, Polymark's transfers must meet the same high standards to ensure full protection.

Standard flame-retardant transfers work well on inherently flame-retardant fabrics. However, as fabrics continue to evolve, garments with flame-retardant coatings may require increased protection. For these cases, Polymark has developed the FR+feature—offering unique flame-retardant protection across a broad range of certified fabrics, including the latest treated materials.

FR+ is available for our Polytrans and Reflective transfers, and meets key industry standards such as EN ISO 11612, 11611, 13668 and 14116, making sure that workforces are fully protected, from fabric to transfer, in the most demanding high-risk environments.

Extensively nc. limited flame spread

meet industry standards, we always recommend having both fabric and transfer tested through our free testing services.
